

A Truth-based Architecture for Grounded Cognition

A distributed AI system that separates sources of knowledge into a distributed and secure epistemic layer, and operates on that layer using a cognitive grammar in high-dimensional perceptual and conceptual spaces.

WikiOracle

WikiOracle is a truthful, explainable LLM system designed as a public good; the Wikipedia model applied to artificial intelligence.

- Truth is preserved and managed explicitly.
- Data is encrypted and stored publically.
- Data, models, and keys can be shared within a network of trust.

Epistemic Model

Truth objects are explicit records that separate verifiable claims, subjective reports, sources, authorities and model providers.

Object	Status	Role
fact	verifiable	Grounds reasoning and can train weights.
feeling	subjective	Session-only signal; never trains or persists.
reference	source	Grounds claims in external evidence.
authority	remote TruthSet	Imports structured truth with scaled trust.
provider	expert mind	Contributes facts/feelings through voting.

Distributed Architecture

Runtime state stays outside the server and moves between client, encrypted storage and model providers.

Object	Location
Server	Stateless HTTPS service; state is supplied by the client.
Client	Web interface for conversation, truth editing and provider selection.
Storage	Conversations and truth are stored as AES-256 ZIP files on Dropbox.
Models	Routes to multiple LLMs, including Basic Model as one provider.

Privacy Policy

Privacy policy separates persistent public knowledge from optional personal facts; feelings remain session-only.

Channel	TruthSet	Weights	Session
Universal facts	yes	yes	yes
Particular facts	optional	yes	yes
Feelings	no	no	yes

Overview

- Frames machine cognition as an inspectability problem: if artificial systems are discussed as possible subjects or epistemic agents, their truth boundaries and update rules should be available for mathematical scrutiny.
- Separates truth claims from subjective reports and source authority.
- Defines inspectable confidence, certainty and update gates.
- Provides a more humanistic interface to machine cognition.
- Keeps feelings outside the truth lattice and training set.
- Supports multiple frames of reference.

LLM comparison

Safety and Interpretability using a Symbolic Firewall

The symbolic firewall keeps model state typed, addressable and inspectable so updates can be audited.

Item	Why it matters / discussion hook
No anonymous state	Persistent vectors live in addressed codebook rows or STM slots.
Typed units	Percepts, concepts, symbols and operators declare roles and valid operations.
Auditable mutation	Semantic changes should expose deltas, masks, confidence and provenance.
Grounding	Can a model expose its path from perception to symbol rather than only output text?
Cognition	Do symbolic and syntactic constraints give a better mathematical object for machine minds?

BasicModel

GitHub.com/ArborRhythms/BasicModel develops the symbolic and syntactic cognition model that WikiOracle can host as one LLM provider. The poster treats it as an inspectible counterpoint to black-box transformer behavior.

Basic Model spaces

Principal Computational Components

Basic Model decomposes cognition into interacting computational components rather than a single opaque weight field.

Piece	Basic Model treatment
Mereology	Two towers expose part-percept extents and whole-percept intents instead of leaving structure implicit in weights.
Attention	Typed attention ranges over input, STM, LTM, PartSpace, WholeSpace and SymbolSpace.
Hierarchy	Serial referential lookup and grammar composition shape references after parallel perceptual settling.
STM	A depth-limited concept-space working set tracks serial or whole-slab sentence state.
LTM	End-state chains and stored truths support inter-sentence prediction and recall.

Reasoning within Conceptual Space

Conceptual Space stores and manipulates truth-bearing structures through explicit mechanisms.

Mechanism	Basic Model content
Truth	Degree-of-Truth scaled propositions are stored, queried and checked for consistency.
Luminosity	Coverage and consonance guide acceptance, derivation and validity of stored truth.
Ideas	ConceptualSpace holds sentence-level working states as ideas in STM.
Relations	Concept codebook rows and symbolic graph edges encode part/whole, equality and derived chains.
